

# ABSTRACT

In this RFID card issuing system, manual operations are required only in two steps of: inputting personal information of an RFID card holder to register it in database; and pushing a shutter button of a camera at the photographing, and software controls are employed for the steps of: copying an image file of a computer COM4 from the camera CAM, changing the file name to a suitable name, and registering the name in the database to associate it with the personal information; printing the image file and personal information on a new card NC; and reading an ID number from an inlet stuck to a rear surface of the new card NC during the printing and registering the ID number in the database to associate it with the personal information and image file. Therefore, it is possible to reduce the issuing time and simplify the issuing process of the RFID card.
